DEVANG PATEL INSTITUTE OF ADVANCE TECHNOLOGY & RESEARCH (DEPSTAR)				
DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING				
PROJECT PROPOSAL SUBMISSION (Review 1)				
Semester:	4	Div.:	1	Course Name: Project II
Course Code: CSE210				Date: 22-01-2025
Details of Project Team				
Group No. (if any):				
Sr. No.	Student's Roll Number	Name of Student	Student's e-mail Address	Student's Contact No.
1	23DCS021	Jugvi Desai	23dcs021@charusat.edu.in	7575068089
2	23DCS023	James Dhandhukiya	23dcs023@charusat.edu.in	9023271511
3	23DCS072	Disha Patel	23dcs072@charusat.edu.in	9016550912

Sr. No:	Parameters:	Description:
a	Project Title	Paw Portal
b	Domain of Project Definition	Web Development
c	Problem Statement: A problem statement in a project clearly defines the issue that needs to be solved. It explains what the problem is, why it matters, and show the problem's impact. This helps focus the project and guides the development of effective solutions.	Individuals and organizations dedicated to animal welfare face challenges in coordinating efforts for rescues, fostering, and feeding programs. Existing solutions lack centralized platforms to integrate volunteer management, donation systems, animal adoption processes, and educational content, creating inefficiencies in addressing the needs of stray animals and fostering community engagement.
d	Project Objectives and Scope: Project objectives are specific, measurable goals that the project aims to achieve. They provide a clear direction and serve as benchmarks for evaluating the project's success. Scope: The project scope outlines the boundaries and deliverables of the project, detailing what will and will not be included. It sets the context for what the project will accomplish and helps manage stakeholder expectations.	This project aims to develop a web application that centralizes and streamlines animal rescue efforts by enabling user participation in volunteer programs, managing donations, facilitating pet adoption, and providing educational resources. Scope: The project includes: Volunteer Registration and Management: Users can sign up to become volunteers for rescue operations, foster homes, or feeding programs. Includes volunteer profiles, activity tracking, and scheduling. Donation Integration: Offer a system for one-time and recurring donations, integrated with platforms like PayPal or Stripe, with transparent

		reporting on fund utilization. • Pet Profile and Adoption Process: Detailed animal profiles with photos, descriptions, and medical histories. Users can submit and track adoption applications. • Map Integration: Interactive maps where users can report stray animal sightings, helping rescue teams prioritize high-density areas and track activities. • Educational Content: Provide articles, videos, and tutorials on rescuing, caring, and transporting animals, along with sterilization importance. • Pet Surrender and Foster Requests: Users can request foster care for strays or surrender pets they can no longer care for. • Impact Dashboard: Display metrics such as the number of animals rescued, adopted, fostered, or sterilized for transparency and motivation. • Crowdsourcing Rescues: Enable rescue requests for specific animals, allowing volunteers to sign up and track rescue progress. Exclusions: • Focus solely on a web application; no dedicated mobile apps for Android or iOS. • The platform will not validate the authenticity of listed NGOs or organizations. • Will not include features for managing detailed NGO activities, events, or fundraising campaigns.
--	--	---

e	Background Study of Existing System The background study involves an examination of the existing relevant systems or technology that the project seeks to improve or replace. This includes an analysis of its architecture, functionalities, strengths, and weaknesses.	The background study examines the current technologies, platforms, and methods used for animal welfare management, highlighting their strengths and limitations to identify gaps this project seeks to fill. Existing Platforms and Technologies: • Google Maps and Other Location-Based Services: ○ Features: Provide location-based searching for NGOs, shelters, and animal welfare organizations with directions, user reviews, and contact details.
---	---	--

		○ Strengths: Accurate GPS-based routing and mapping; widely accessible. ○ Limitations: Lack categorization based on specific causes or needs; no real-time updates on NGO activity status; does not integrate features for direct volunteer management or stray animal tracking. • Pet Adoption Websites (e.g., Petfinder, Adopt-a-Pet): ○ Features: Host profiles of animals available for adoption, including photos, descriptions, and basic medical history. Some offer application tracking for adoptions. ○ Strengths: Specialized in adoption processes; provide visibility to adoptable pets. ○ Limitations: Limited focus on additional services like volunteer management, educational content, or tracking stray animals. Identified Gaps in Current Systems: • No single platform integrates all key features such as volunteer coordination, donation systems, pet adoption, and stray tracking into a unified ecosystem. • Limited support for personalization based on user preferences or real-time status checks for NGOs. • Absence of educational tools or centralized dashboards to measure and display impact. By addressing these gaps, Paw Portal aims to innovate a unified platform that not only centralizes resources but also empowers individuals to actively contribute to animal welfare initiatives.
g	Tentative Project Plan, Timeline and individual role The project timeline provides the project schedule, highlighting key milestones, deadlines, and the duration of each phase.	Timeline and Project Plan 1. Setting up the environment and familiarizing with tools - 3 weeks 2. Outlining the frontend and backend - 1 week 3. Building core features (volunteer management, donation system, and pet adoption) - 3 weeks 4. Adding map integration and rescue tracking - 2 weeks 5. Testing and bug fixing - 2 weeks 6. Final deployment and impact dashboard - 2 weeks Tentative Time Required: 13 weeks. Starting in January, the project will be ready by April.

h	Innovation and Originality Innovation: The innovation aspect of the project refers to the novel features, methodologies, or technologies introduced to address the problem in a new and effective way. Originality: Originality emphasizes the project's uniqueness and contribution to the field. It involves the creation of new knowledge, concepts, or products that have not been previously developed.	Innovation: - Centralized platform combining volunteer management, donations, pet adoption, and rescue operations. - Real-time updates and tracking for stray animal sightings and rescue efforts. - Seamless API integration for maps and payment systems. - Personalized user experiences with account-based features and intuitive interfaces. Originality: - Unified approach to addressing animal welfare challenges by consolidating multiple functions into a single platform. - Real-time NGO activity verification and crowdsourced rescue coordination, bridging gaps in existing systems. - Enhanced community engagement through education and impact transparency, empowering individuals to act.
